

EVALUATION REPORT

1. Overall Project and Team Performance

- Completion Level: The team successfully met the objectives set across all Sprints (from Sprint 1 to Sprint 5). The rental property management software project now includes all core requested functionalities.
- Task Distribution and Collaboration: There was a clear division of tasks between the Frontend and Backend components. The team strictly adhered to source code management best practices (Git/GitHub), utilizing separate `branches` and executing `Pull Requests` professionally to merge code into the `main` branch. As a result, the project rarely encountered merge conflicts, and a steady development pace was maintained throughout.

2. Peer Evaluation

2.1. Doan Quoc Kien (*Project Lead / Core Backend*)

- Strengths / Contributions:
 - Acted as a Project Manager / Tech Lead, taking primary responsibility for reviewing code, resolving conflicts, and merging Pull Requests from other members into the `main` branch.
 - Took charge of developing crucial core features on the Backend, such as the Payment flow, mock payment methods, and an audit logging system for security (tracking contract and room mutations).
 - Maintained an excellent comprehensive view of both the Frontend and Backend architecture, stepping in to help debug during critical sprint phases.
- Overall Assessment: Performed exceptionally well in managing the source code and contributing core components. Displayed a highly responsible attitude.

2.2. Dang Vo Tuan Tai (*Frontend Developer*)

- Strengths / Contributions:
 - One of the most active contributors with the highest commit count (around 38 commits), demonstrating diligence and consistent adherence to the project schedule.
 - Handled complex data logic on the user interface, including: Invoice management, Notification systems, and displaying financial/operational Statistics.
 - Actively fixed bugs and updated the UI continuously to ensure the application operated smoothly during final Sprints.

- Overall Assessment: Achieved a very high productivity level. Possesses solid Frontend programming skills, consistently taking the initiative to fix bugs and meet Sprint deadlines.

2.3. Tran Vinh Khang (Backend Developer)

- Strengths / Contributions:

- Responsible for designing and implementing numerous essential APIs that formed the foundation of the application: Notification API, Financial Statistics API, Contract Details API, and New Account Approval API.

- The API structure was written clearly with sound logic, providing accurate and sufficient data, which made integration easy for the Frontend team.

- Excelled in building the Backend from its initial architecture through to the completion of Sprint 5.

- Overall Assessment: Has a strong grasp of Backend business logic. Demonstrates excellent independent problem-solving skills and communicates effectively with the Frontend team to provide APIs promptly.

2.4. Nguyen Khoi Nguyen (Frontend / UX Developer)

- Strengths / Contributions:

- Strongly focused on User Experience (UX) and Frontend feature optimization.

- Implemented specific and meticulous features, such as: A mobile-friendly payment API flow (utilizing Axios to prevent mobile blocking), image upload functionality, and adding detailed tenant information fields (Citizen ID, Date of Birth).

- Notably executed a "major overhaul" of the user interface structure in the final stages and added appealing visual effects (like fireworks), making the app look significantly more professional and polished.

- Overall Assessment: Highly meticulous with a great eye for design in refining the UI/UX. The extra effort put into "Nice-to-have" features greatly enhanced the overall quality and premium feel of the product.

3. Self-Evaluation

Member Name: Tran Vinh Khang

Self-reflection gathered from the project:

> "I successfully built an API Backend system that supports all the main features of the app comprehensively. I gained a firmer grasp of writing RESTful APIs and executing Database queries. An area for improvement would be adding more Unit Tests for the APIs to catch edge cases more strictly before handing them over to the Frontend team."
